## COMMENTS TO THE AUTHOR(S)

Please provide your evaluations of the manuscript and the reasons for your recommendation by filling in the **Comments/Remarks** column below. Your comments will be passed on to the author(s) without revealing your identity. Please elaborate the detailed recommendation by focusing on the strengths and weaknesses of the manuscript. If you recommend any revision, please specify how the author should accomplish it.

	<b>Comments/Remarks</b>
<b>Introduction</b>	There should have been more argument on the novelty of the research. What is different in this research compared to previous ones, in terms of self congruity and loyalty ? Is it about the globalization ? Why coffee shop is chosen as the context of study ?
	The authors also need to provide more convincing narratives on the importance of self congruity variable, compared to other consumer characteristics, such as self esteem, self actualization etc in determining consumer loyalty
<b>Literature Review</b>	The authors need to add Spurious loyalty, and Customer Satisfaction in this section, and provide arguments that the research has somehow avoided the confounding effect of these two variables in the measurement of loyalty.
<b>Methodology</b>	More detailed explanations are required on the mechanism of data collection. Was it conducted through face to face interaction ? Online questionnaire ? Self administered ? What is the response rate ?
	A complete questionnaire shall also be attached in the appendix
<b>Findings</b>	Need to show the demographics distribution of respondents
	It would have been better if the authors show 3 diagrams instead of tables and numbers. The 3 diagrams consist of Starbuck model, Anomaly Model, and Combined model

<b>Discussions</b>	Lack of in depth analysis as to why Starbuck model is different with Anomaly model. What psychology mechanism at work in explaining the difference ?
<b>Implications to Management</b>	Not really obvious. The authors need to get more specific about the managerial actions required to respond to self congruity of consumers. Should Starbuck changed its logo, for example ? Be specific.
<b>Academic Implications</b>	Almost non existent. No contributions to academic domain. This is purely a replication research
<b>Others/Overall</b>	Overall, the article is nice to know/to read but not many insights, even information that we did not know before.
	Moderate revisions required to articulate novelty and put emphasis on managerial implications section.

## COMMENTS TO THE AUTHOR(S)

Please provide your evaluations of the manuscript and the reasons for your recommendation by filling in the **Comments/Remarks** column below. Your comments will be passed on to the author(s) without revealing your identity. Please elaborate the detailed recommendation by focusing on the strengths and weaknesses of the manuscript. If you recommend any revision, please specify how the author should accomplish it.

	Comments/Remarks	Our Responses to Reviewers' Comments
Introduction	There should have been more argument on the novelty of the research. What is different in this research compared to previous ones, in terms of self congruity and loyalty ? Is it about the globalization ? Why coffee shop is chosen as the context of study ?	<p>Thank you for the comment.</p> <p>We add several lines of argumentation of the contribution of the research.</p> <p>We argue that such a comparative analysis between international coffee shops versus local coffee shops would provide insights whether consumers in developing countries have constructed their self-image congruent with the global image constructed by international coffee-chain. Comparing scores of consumers' self-congruity with international-coffee chain's image with those with local-coffee chain's would contribute to the globalization discourse in which globalization is perceived to generate homogenization of identity of consumers in different parts of the world</p>
	The authors also need to provide more convincing narratives on the importance of self congruity variable, compared to other consumer characteristics, such as self esteem, self actualization etc in determining consumer loyalty	<p>Thank you for the comments.</p> <p>We add lines of argumentation on this matter in the manuscript.</p> <p>We agree that there are a lot of factor influencing customer loyalty.</p> <p>We specifically study self-congruity since the main interest of this study is the contestation between global versus local images constructed by</p>

		global versus local coffee chains in shaping emerging countries' identity to be congruent with the images constructed by such global/local players.
<b>Literature Review</b>	The authors need to add Spurious loyalty, and Customer Satisfaction in this section, and provide arguments that the research has somehow avoided the confounding effect of these two variables in the measurement of loyalty.	We already mentioned in the literature review that customer loyalty we study is in terms of both attitudinal loyalty and behavioral loyalty (see literature review). Behavioral loyalty measures actual behavior or regular patronage to the coffee shops. Therefore, we can overlook spurious loyalty.  Similarly, since we take the definition of loyalty of its behavioral aspects, we can overlook satisfaction. The actual behavior of regular patronage is the one which matters.
<b>Methodology</b>	More detailed explanations are required on the mechanism of data collection. Was it conducted through face to face interaction ? Online questionnaire ? Self administered ? What is the response rate ?	Thank you for the comment.  We add information as required in the manuscript.
	A complete questionnaire shall also be attached in the appendix	We present a table consisting the measurement we used to construct the questionnaire (see Table 12 in the Appendix)
<b>Findings</b>	Need to show the demographics distribution of respondents	Characteristics of Respondents (demographic and behavioral characteristics) are already presented at Table 9 in the manuscript.
	It would have been better if the authors show 3 diagrams instead of tables and numbers. The 3 diagrams consist of Starbuck model, Anomaly Model, and Combined model	Thank you for the comment.  We would like to keep the tables to provide results of data. We have also presented in one table for results of those of Starbucks', Anomali's and All Data's models to ease readers in comparing their results.

<b>Discussions</b>	Lack of in depth analysis as to why Starbuck model is different with Anomaly model. What psychology mechanism at work in explaining the difference ?	Thank you for the comment. Additional explanations (in red) are presented.
<b>Implications to Management</b>	Not really obvious. The authors need to get more specific about the managerial actions required to respond to self congruity of consumers. Should Starbuck changed its logo, for example ? Be specific.	Thank you for the comment. We add implications for targeting and marketing communication strategies (in red).
<b>Academic Implications</b>	Almost non existent. No contributions to academic domain. This is purely a replication research	Thank you for the comment. We add academic implication of the research (in red).
<b>Others/Overall</b>	Overall, the article is nice to know/to read but not many insights, even information that we did not know before.	We add lines of argumentation to communicate the contribution of the study.
	Moderate revisions required to articulate novelty and put emphasis on managerial implications section.

## Abstract

**Manuscript type:** *Research Paper*

**Research Aims:** *This paper seeks to examine the concept of “self-congruity” and its direct and indirect impacts on consumer loyalty of global versus coffee shops.*

**Design/methodology/approach:** *The study is a quantitative study using online survey on 400 respondents, which were distributed evenly to consumers of Starbucks (as a global coffee shop) and Anomali Coffee (as a local coffee shop in Jakarta, Indonesia). This paper employs Structural Equation Modelling (SEM) to study the relationships amongst variables.*

**Research Findings:** *Results of the research show that generally self-congruity has a positive direct and indirect effect on customer loyalty.*

**Theoretical Contribution/Originality:** *The research conveys that self-congruity consistently predicts consumer loyalty in various research settings, while environment perception, service perception, product perception, and price perception can influence consumer loyalty in different manners depending on the research context. The research contexts studied (global versus local coffee shops) also contributes to the discussion of globalization effects.*

**Practitioner/Policy Implications:** *Life style products should develop strategies to match the product’s concepts with those of consumer values, particularly with regards to products with global versus local images. Furthermore, managers should pay attention to their pricing strategies where price perception can influence consumer loyalty.*

**Research limitation/Implications:** *This study overlooks stages in the consumer’s purchase decision process where self-congruity can particularly affect a certain stage to finally result in consumer loyalty.*

**Keywords:** customer loyalty, global versus local coffee shops, self-congruity

---

## INTRODUCTION

The development of the coffee shop business has become phenomenal urban cities, including in emerging countries. A lot of coffee shops are flooding in the market. In Jakarta, as Indonesia's capital city, there are as many as 1,083 brands of coffee shops (Wibisono, 2016). The Euromonitor report showed that in Indonesia, the growth of café with coffee shop concept reached 16% every year since 2008 (Sudarsana, 2016). The Advisory Board of the Joint Indonesian Coffee Exporters (GAEKI) said that the growth of coffee consumption has always been more than 8% in Indonesia every year, which is above the growth of global coffee demand (2.5%) in 2016 (Idris, 2017). In 2020, the trade value of business is estimated to reach US\$ 1 billion (Wibisono, 2016).

The high competition in the business has caused companies to find it difficult to increase the number of consumers in the existing market. Even though marketers already have a target market segment that is considered loyal, the competitive pressure is intense and deliberately directed at changing consumer loyalty and enabling the transfer of brands. Consumers will develop positive attitude and loyalty towards these products

after consumers receive and feel the benefits or value of a product (Mowen and Minor, 2002: 89). The success of a company is largely determined by customer loyalty.

Several studies conclude that conformity can be a very significant factor in customer loyalty (Jamal and Goode, 2001; Sirgy et al., 1991). Conformity is a suitable match between one's self-image and product image, or self-congruity. Following Shamah (2007), this research was conducted to analyze direct and indirect impact of self-congruity on customer loyalty. Further, Shamah (2007) states that there are indirect and direct impact of self-congruity on loyalty. The indirect impact of self-congruity is mediated by consumer perception. Consumer perceptions include perception of environment, services, product, and prices (Hyun, 2010 and Soriano, 2002).

The relationships amongst those variables can draw more interests when placed in the context of globalization and consumption in cosmopolitan cities, including Jakarta. The rise of globalization and development of transnational consumption practices have resulted in the growing number of global branded coffee shop chains. Grinshpun (2012) argues that the global chains are viewed as material

flows of commodities, images, and cultural representations, which forge new connectivities between world locations. The global chains, such as and mainly Starbucks, offer its own consumption experience.

However, in the same time, there was also a rapid growth of local brand of coffee shops which attracts their own target market segments. In Jakarta, there were some famous local brands of coffee shops, with the most famous one called 'Anomali'. Anomali is a local brands with more than 20 branches and has been a 'hot place' for coffee shop fans in Jakarta. What are the difference of consumption experience created by these global versus local coffee shops? What kind of subjectivity created? How the consumers compare their self-image/self-concept with the product image (i.e., self congruity)? How self congruity influence their perceptions and in turn their loyalty?

While self-congruity has been previously researched, the present research seeks to provide comparison of self-congruity of emerging country consumers with images constructed by international-chain coffee shops versus local-chain coffee shops. Self-congruity is the comparison between self-image/self-concept and the product image which consumer has and formed from evaluation

between product image and affective response (Sirgy et al., 1991 in Kang et al., 2012). Therefore, such a comparative analysis between international coffee shops versus local coffee shops would provide insights whether consumers in developing countries have constructed their self-image congruent with the global image constructed by international coffee-chain. Comparing scores of consumers' self-congruity with international-coffee chain's image with those with local-coffee chain's would contribute to the globalization discourse in which globalization is perceived to generate homogenization of identity of consumers in different parts of the world. Results of this research would also provide insights whether local coffee shops which offer localized experiences would be deemed attractive by local consumers.

While there are other factors influencing consumers' behavior, such as consumers' self-esteem and self-actualization (Maslow's hierarchy of needs), the contestation between global versus local images constructed by global versus local coffee chains in shaping emerging countries' identity to be congruent with those images is the main interest of this study.

The objectives of this study is twofolds. First, we examine the influence

of self-congruity on consumer perception and loyalty. Second, we test the relationships of the variables in the contexts of global brand of coffee shop chain (that is, Starbucks) and local brand of coffee shop chain (that is, Anomali). In doing so, we split the model into three, that is, Alldata model, Starbucks model, and Anomali model. This would also serve as an initial attempt to explore whether the conceptual model holds in both contexts.

## **LITERATURE REVIEW**

### ***2.1. Self-congruity***

Self-congruity is the comparison between the self-image/self-concept and the product image which consumer has and formed from evaluation between product image and affective response (Sirgy et al., 1991 in Kang et al., 2012). It means the consumer find the suitable between product-user image and self-concept (Sirgy et al., 1985). Moreover, a success attributes/factors can seen from brand that strongly influenced by self-congruity (Aguirre-Rodriguez, et al., 2012 on Klipfel et al., 2014). Consumers buy products and brands that they trust to process symbolic images that resemble or complement consumers' self-image, which will later

achieve conformity (Bierley et al. 1988, in Aghdaie in Khatami (2014).

Sirgy et al. (2006, in Koolivandi and Lotfizadeh, 2015) explains that self-congruity includes cognitive and affective assessments of brand names or services or products with characteristics that match consumers. According to Aaker (1999) consumers develop internal imagery with respect to products, brands, or services, which are shown in many ways, including through direct contact or through word-of-mouth communication. Consumers who find or accept a match between their image (self-image) and the acceptance of a product or brand image (Liu, Lin and Wang, 2012).

One of categories which will result in customer switching behavior is pricing (Keaveney, 1995). The price factors can include high prices, price increases, unfair pricing, and deceptive pricing. Therefore, perception on services provided by a coffee shop will be formed based on evaluation of products (the coffee, drinks, or food served), environment of the coffee shops (including the design, ambience, and furniture), and price.

### ***2.2. The Influence Factors of Consumer Perception in Service Industry***

Services which are intangible will be evaluated based on their physical attributes. Therefore, service companies will try to communicate their service quality through physical evidence and presentation (Kotler and Keller, 2012). There are a few marketing tools available to influence consumer's positive evaluation, i.e., place (the exterior and interior of the place), people (employee with good service attitude), equipment (the look of the equipment), communication materials which suggest efficiency and speed, symbols which suggest fast service, and price of the products and services.

Customer choices for service products also depend on intangible attributes, that is the service itself. Parasuraman, Zeithaml, and Berry (1985) state that service quality is evaluated by five dimensions, that is, reliability, assurance, tangibles, empathy, and responsiveness. Their model shows that tangibles relate with the physical evidence of the service, as mentioned earlier, while the other dimensions concern on how the service is delivered to customers.

Service-outcome and customer loyalty is also influenced by various factors. One of categories which will result in customer switching behavior is pricing (Keaveney, 1995). The price factors can include high prices, price increases, unfair

pricing, and deceptive pricing. Therefore, perception on services provided by a coffee shop will be formed based on evaluation of products (the coffee, drinks, or food served), environment of the coffee shops (including the design, ambience, and furniture), and price.

### **2.3. Loyalty**

Loyalty has received a significant amount in consumer research. Oliver defines loyalty as "a deeply held commitment to rebuy or repatronize a preferred product/service" (1997, p. 392.). Meanwhile, Kotler and Keller (2016:27) stated that customer loyalty is a situation where customer consistently purchase all the budget to buy a product from the same seller. Prior research has often defined loyalty as both attitudinal or behavioral commitment to a brand (Dick and Basu 1994; Oliver 1999). The attitudinal loyalty states that true loyalty exists when there exist favorable beliefs toward the brand. The behavioral approach views loyalty as expressed behavior, and defines loyalty as a customer's propensity to buy a brand with reference to the pattern of past purchases (Russell and Kamakura 1994). In this research, referring to Chaudhuri (1999) we view loyalty as a combination of attitude and habit. Loyalty is the outcome of experience of consumers after visiting a

coffeeshop. The experience can provide certain satisfaction level and form attitudinal loyalty towards the coffee shop. Visiting a coffee shop can also become a habit, in which a consumer has a tendency to visit the same coffee shop despite the low level of satisfaction, due to perhaps the strategic location of the coffee shop (i.e., near one's office or home). On the other hand, a selection of coffee shop can be attitudinal commitment. Drinking coffee can also be a statement of one's self-concept or lifestyle. The widespread of coffee shops in metropolitan city has also offered a wide selection of coffee shop. Having observed the emergence of various coffee shop brands in Jakarta has led us to relate loyalty with self-congruity.

#### ***2.4. Globalization of consumption***

There are prior studies of the globalization of consumption, with the research objects of various global brands including Starbucks (Thompson and Arsel, 2004). Starbucks has indeed created the coffee culture around the world and has proven to be the 'standard' coffee shop experience at most cosmopolitan cities in the world, including Jakarta. Globalization of consumption has been studied as homogenization where transnational corporations colonize local cultures (Falk

1999). However, anthropological research suggest that the seemingly standardized experience of global brand consumption has actually varied and perceived differently by consumers.

Grinshpun (2012) studied the meanings created and attached to Starbucks by Japanese consumers and argued that Starbucks offer "cool and foreign" cultural contexts which are packaged and reconstructed in visual, spatial, audio, olfactory, and other environmental elements. However, Thompson and Arsel (2004) stated that there were no similar let alone single interpretation on Starbucks. The interjection of global brands into local cultures paradoxically produces heterogeneity as global brands take on a variety of localized meanings. Not just localized meaning towards the global brand, we see phenomenon that global brands have also created their local product versions. Starbucks, which has created coffee culture, has also created local entrepreneurs to open local coffeeshops. For example, in Jakarta, the coffee lifestyle created by Starbucks has created a lot of local coffee chains which somehow position themselves as an antithesis to the globalized image offered by Starbucks and the created a local and independent style image. One of the most successful local brands of coffee shop is 'Anomali'.

We take Grinshpun (2012) and Thompson and Arsel (2004)'s theses as a basis for our present study that there are subjective interpretations by consumers towards the brand they consume. Eventhough the global brand carry and try to impose standard global identity, local consumers will somehow interpret their consumption experience based on their personal subjective consideration. Therefore, in this study we use self-congruity as one of the factors forming consumers' perception and loyalty towards coffee shops.

As an early attempt, we merely compare consumer responses in terms of self-congruity, perception on environment, products, services, and price, and loyalty for Starbucks versus Anomali. We also compare the magnitude of influences of variables on the others as theoretically proposed and empirically tested by Shahmah et.al (2007) in these two contexts to whether the model holds for service organization with different characteristics, that is, global-chain coffee shops and local-chain coffee shops.

## **RESEARCH METHOD**

### ***3.1 Hypotheses Development***

#### ***3.1.1 Relationship between Self-congruity and Loyalty***

The direct relationship between self-congruity and customer loyalty hasbeen confirmend in various studies (Sirgy, 1986; Back, 2005; Kressmann et al., 2006; Sirgy et al., 2008; Liu et al., 2012).Oliver (2010) and Kotler and Keller (2016:27) said that loyal customer is a customer who has commitment to stand a long time to be a loyal customer (subscriber) that want to comes and purchase many times in the future, even the other competitor trying to steal other brand's customer loyalty.

Since self-congruity refers to the degree of compatibility or discrepancy between individual consumer perceptions of the product or brand and the perception of him/herself (Sirgy, 1980), the more similar the two concepts are, the higher the preference for the brand. When self-congruity is perceived by consumers to be higher, the consumer tend to like the brand and will become regular patron (Liu et al, 2012). Higher self-congruity means more positive attitudes (Graeff, 1997) which will result in higher loyalty (Sirgy et al., 1997; Back, 2005).Therefore, we formulate Hypothesis 1 as follows

**H1.** Self-congruity has a positive effect on customer loyalty.

#### ***3.1.2 Self-congruity and Consumer Perception***

Belk (1988) argues that understanding consumer behavior requires understanding on how one construct meanings to his/her possession or choice of consumption. The congruity between consumption and the sense of self will determine one's perception on the product/service consumed. Graeff (1996) also states that there is a positive relationship between consumer image congruity and perception on products, brands, or services. Self-congruity where the image of a product or service or brand is considered increasingly approaching consumer self-concepts will determine the perceptions on various stimuli surrounding the coffee shops.

Based on those reasonings, we formulate Hypotheses 2a until 2d as follows

**H2a.** Self-congruity has a positive effect on the perception of the environment.

**H2b.** Self-congruity has a positive effect on the perception of services.

**H2c.** Self-congruity has a positive effect on product perception.

**H2d.** Self-congruity has a positive effect on price perception.

### **3.1.3 Consumer Perception and Customer Loyalty**

The environmental perception has been proven to be the most relevant factor

that most influence customer perception and behavior, especially related to the restaurant industry (Han and Ryu, 2009; Liu and Jang, 2009; Ryu et al., 2012). The service perception is an employee. It is believed to be an important factor in customer loyalty to the restaurant industry (Reich et al., 2005). The Product perception (product quality) represent most of the decision process/determinants related to loyal behavior in restaurant settings (Clark and Wood, 1999; Ha and Jang, 2010). Price perception is found as a significantly influences the increase in loyalty (Sirohi et al., 1998).

**H3a.** Environmental perception has a positive effect on customer loyalty.

**H3b.** Service perception has a positive effect on customer loyalty.

**H3c.** Product perception has a positive effect on customer loyalty.

**H3d.** Price perception has a positive effect on customer loyalty.

### **3.2 Method**

#### **3.2.1 Research Design and Data Analysis Technique**

This research employs a quantitative approach which focus on hypothesis testing. Data were collected by distributing questionnaire. The distribution of the questionnaire was conducted online using SurveyMonkey. To test the conceptual model, data were subjected to Structural Equation Modelling (SEM) analysis supported by AMOS 22<sup>nd</sup> version. Total sample consisted of 400 respondents, which was divided equally to Starbucks sub-sample and Anomali Sub-sample. The sample member is consumer who is at least 18 years old and has visited Starbucks or Anomali Coffee at least three times. We tested the structural model three times, using Starbucks sample, Anomali sample, and All Data. While the All data sample model was analyzed to test the hypotheses, the separate analyses for Starbucks and Anomali served as an initial attempt to examine the comparative results from the Starbucks (global-chain coffee shop brand) sample vis-à-vis Anomali (local-chain coffee shop brand) sample. This would also serve as an attempt to explore whether the conceptual model holds in both contexts.

#### **3.2.2 Measurement**

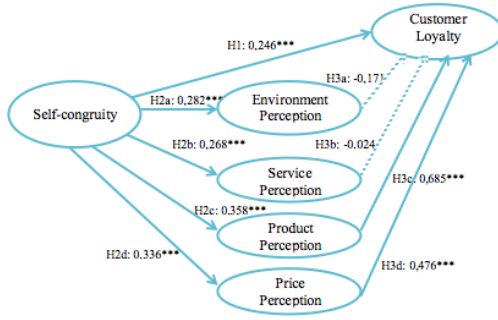

The measurement for the variables was adapted from Shamah et al. (2017). A 7-point Likert scale was used to quantify the responses. Measurements include 12 statements for self-congruity variables, 15 statements for environmental perception variables, 11 statements for service perception, 13 statements for product perception, 5 statements for price perception, and 9 statements for customer loyalty. Items used to construct the questionnaire are presented in the APPENDIX.

## **RESULT AND DISCUSSION**

This research test the measurement model (see Figure 2) and the data to get good and accurate results. The data analyses involve several tests. First, normality test. This test was conducted employing Structural Equation Modeling (SEM) technique. In SEM which uses Maximum Likelihood technique in estimation, normality assumption of the data was required. The value of the critical ratio (CR) can be determined based on the significance level of 1% which is equal to  $\pm 2.58$  (Hair et al, 2006). The result of normality test (Appendix C) for three models are 91.83% normally distributed for Starbucks respondents, 81.63%

normally distributed for Anomali Coffee respondent, and 79.59% normally distributed for All Data. This shows good results for the three models.

Notes:

The reliability of measurement for each of the variables is assessed by examining the consistency of the respondent's answers to each of the questions that measure the variable. The reliability of a variable can be assessed by the value of Cronbach Alpha Coefficient.

The higher the coefficient, the higher the reliability is (Hilton and Brownlow, 2004). The results of reliability tests (see Table 4) showed good results, in which the coefficients were above 0.9.

The validity tests are used to measure the validity of the measurement for each of the variables. Tests of convergent and discriminant validity were then conducted. The convergent validity test employed AVE calculations and the discriminant validity test used MSV calculations (Hair et al, 2006). Convergence validity (see Table 5) test was examined based on the value of the loading factor of each indicator. The test results in good values, because all values were above 0.5.

Table 4. The Reliability Test of All Data

Variable	Value	Criteria
Self-congruity	0.937	According to Hilton and Brownlow (2004), data is reliable if the value of Cronbach Alpha: If alpha>0.90 then reliability is perfect. If alpha is between 0.70 - 0.90 then reliability is high.
Price Perception	0.919	
Service Perception	0.940	
Product Perception	0.939	
Environment Perception	0.973	
Customer Loyalty	0.905	

Table 5. The Convergent Validity Test of All Data

Indicator	Value of AVE	Criteria
Self-congruity	0.681	According to Churchill (1979) and Holmes-Smith (2002), data are convergent if the value of AVE more than 0.5
Price Perception	0.697	
Service Perception	0.690	
Product Perception	0.625	
Environment Perception	0.680	
Customer Loyalty	0.676	

The last test was Goodness of Fit Index, which were based on 7 criteria on

the model. These criteria were chi-square, chi-square/df, probability, GFI, AGFI, CFI, and RMSEA. The results on Starbucks, Anomali, and the combined model (see Table 6 to Table 8) showed that not all criteria weremet. However, the values were still acceptable because the average value of each criteria for each model laid in the range of zero to one (Santoso, 2012). Although it did not fulfill the criteria but overall the value of each measurement was still acceptable of a fit level 70% and with the value of RMSEA < 0,08. These results were still considered acceptable. Therefore, the structural model was supported by the results of this research.

Table 6. The Result Goodness of Fit Index Respondent of Starbucks

Goodness of Fit Index	Criteria	Result	Conclusion
Chi-square	As low as possible	2228.407	Acceptable
Chi-square/df	≤ 2.00 or 3.00	2.065	Acceptable
Probabilitas	≥ 0.05	0.000	Acceptable
GFI	≥ 0.90	0.721	Acceptable
AGFI	≥ 0.90	0.670	Acceptable
CFI	≥ 0.90	0.901	Acceptable
RMSEA	≤ 0.08	0.073	Acceptable

Table 7. The Result Goodness of Fit Index Respondent of Anomali Coffee

Goodness of Fit Index	Criteria	Result	Conclusion
Chi-square	As low as possible	2611.866	Acceptable
Chi-square/df	≤ 2.00 or 3.00	2.370	Acceptable
Probabilitas	≥ 0.05	0.000	Acceptable
GFI	≥ 0.90	0.795	Acceptable
AGFI	≥ 0.90	0.763	Acceptable
CFI	≥ 0.95	0.928	Acceptable
RMSEA	≤ 0.08	0.059	Acceptable

Table 8. The Result: Goodness of Fit Index (All Data)

<i>Goodness of Fit Index</i>	<b>Criteria</b>	<b>Result</b>	<b>Conclusion</b>
<i>Chi-square</i>	As low as possible	2424.827	<i>Acceptable</i>
<i>Chi-square/df</i>	≤ 2.00 or 3.00	2.401	<i>Acceptable</i>
Probabilitas	≥ 0.05	0.000	<i>Acceptable</i>
GFI	≥ 0.90	0.800	<i>Acceptable</i>
AGFI	≥ 0.90	0.767	<i>Acceptable</i>
CFI	≥ 0.95	0.929	<i>Acceptable</i>
RMSEA	≤ 0.08	0.059	<i>Acceptable</i>

In terms of respondents' profile (see Table 9), the respondents of Starbucks showed similar characteristics with those of Anomali. Respondents were majority between 26-35 years old, undergraduate educational background, average monthly expense was more than Rp5,000,000.- and most of them was coffee enthusiasts. Respondents of both groups have subscribed for more than 3 years and visited the café at least once a month. These characteristic of the respondents can serve as an overview of consumers' profile of coffee shops in Jakarta.

In the hypotheses testing, results on Starbucks sample group (see Table 10) showed that 2 out of 9 hypotheses were not supported (p value greater than 0.05). The hypotheses were the positive influence of environment perception on customer loyalty (H3a) and the positive influence of product perception on customer loyalty (H3c). Therefore, environment perception and product perception failed to mediate the influence of self-congruity on customer loyalty.

Table 10. The Coefficient and Significance of Influence (in three models tested, i.e, for Starbucks, Anomali, and All Data)

Relationship between Variables	Coefficient and Significance of Influence		
	Starbucks	Anomali	All Data
Self-congruity → Customer Loyalty	0.334***	0.257***	0.246***
Self-congruity → Environment Perception	0.300***	0.276***	0.282***
Self-congruity → Service Perception	0.350***	0.262***	0.268***
Self-congruity → Product Perception	0.408***	0.337***	0.358***
Self-congruity → Price Perception	0.404***	0.312***	0.336***
Environment Perception → Customer Loyalty	-0.051	-0.158	-0.171
Service Perception → Customer Loyalty	0.227***	0.047	-0.024

The results on Anomali sample group (see Table 10) showed that 2 out of 9 hypotheses were not supported. The unsupported hypotheses were the positive influence of environment perceptions on customer loyalty (H3a) and the positive influence of service perception on customer loyalty (H3b). Therefore, environment perception and service perception failed to mediate the effect of self-congruity on customer loyalty.

Analyses were also conducted on All-data model (see Table 10 and Figure 2). Results showed that 2 out of 9 hypotheses were not supported (p>0.05). The unsupported hypotheses were the positive influence of environment perception on customer loyalty (H3a) and the positive influence of service perception on customer loyalty (H3b). It therefore implied that environment perception and service perception did not mediate the influence of self-congruity on customer loyalty.

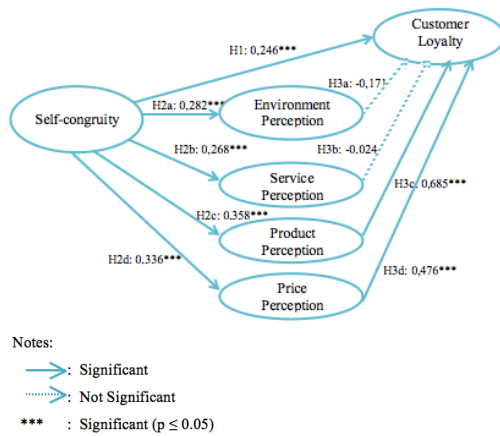

Figure 2. The Structural Model of All Data

The value of R-square showed the ability of independent variables (X) to explain the dependent variable (Y). According to Guilford theory (1956), the results showed that self-congruity, perceptions of the environment, product, service, and price can explain customer loyalty by 75.2% for Starbucks sample. Meanwhile, Anomali sample showed the R-square value of 59% in which self-congruity self-congruity, perceptions of the environment, product, services, and price can explain customer loyalty by 59%.

If we compare results between Starbucks and Anomali, main argumentations about the importance of self-congruity in shaping consumers' perception in the service industry. Self-congruity is also an antecedent of loyalty.

Results in both contexts also show that environment perception does not influence loyalty. This might indicate that consumers' perception in terms of environment of both coffee shops are already formed and therefore do not influence customer loyalty. There are also conflicting evidence. In the context of Starbucks, service perception positively influences customer loyalty, while product

perception does not influence customer loyalty. In the context of Anomali, product perception influences positively customer loyalty while service perception does not. This findings might indicate that service matters in the context of Starbucks. For Anomali, consumers concern with its products.

Besides hypotheses testing, we compare the average scores of each of the variables for Starbucks and Anomali (see Table 11). Interestingly, average scores for Anomali were all higher than those of Starbucks. Statistically, however, only the mean difference in terms of self-congruity and price perception were significant. Respondents of Anomali experience more self-congruity compared to those of Starbucks respondents. The difference of price perception was confirmed with the more expensive prices of Starbucks products compared to Anomali's.

Table 11. The Result of Independent t-test (Starbucks versus Anomali)

Variables	Average Scores for Starbucks	Average Scores for Anomali	Mean Difference
Self-congruity	4.0544	4.2661	-0.22167***)
Environment Perception	6.0207	6.0839	-0.06321

### CONCLUSION

The present research shows the importance of self-congruity in forming consumers' perception on environment, service, product, and price. As Belk (1988) pointed out our possessions (and

consumption) are reflection of one's identity. One's belonging and choice of consumption are the extension of the self. The way one perceives a product/service is indeed a result on the way one perceives agreement (or congruity) between him/herself with the product/service. The importance of self-congruity in influencing customer loyalty is perhaps underlined by the findings that perception on environment, product, and service did not mediate the affect of self-congruity on customer loyalty.

The present research contributes to the understanding of phenomena of symbolic consumption of the society residing in metropolitans. Contextually, this research provides data from Jakarta, the capital city of Indonesia. Indonesia is a fast growing emerging country and is in the Big 20 countries in term of GDP. With the penetration of global brands such as Starbucks, this research provides insights on the development of local brands. While research on the globalization of Starbucks (Grinshpun, 2012; Thompson and Arsel, 2004) has offered useful insights on the adoption of global brands, this present research intentionally compared the perception on global chain versus local chain. The results are intriguing for self-congruity scores for local chain was in fact higher compared to that of global chain. This implies that the society has somehow been more interested in local brands rather than consuming brand with global identity. Also, this may lead to further investigation on the role of global brand in stimulating the growth of local brands or the interrelationships between the global and local brands. In this case, Starbucks has perhaps stimulated the local demand for

coffee shops thus induced the emergence of local brands. Both Starbucks and Anomali have contributed to the market size and growth of coffee shops in Indonesia.

This research offers several managerial implications in developing customer loyalty in the service industry, especially coffee shops in Jakarta. **Due to the importance of self-congruity in forming customer loyalty, companies have to attempt to build congruity between consumers' image (or how consumers perceive themselves) and the image of the company. In doing so, companies have to target specific market segment(s) whose images are congruent with company's images. Alternatively, companies have to formulate market branding and communication strategy in such a way to build congruency between company's image with customer's self-image. For example, international-chain coffee shops can portray its global image via its global branded product, service, outlet, and advertising strategies to appeal to customers with global aspiration. Meanwhile, local coffee shops can communicate its locality (local products, local designs, and local service culture) to appeal to customers who favor locality. Findings of this study also provide insights that in the globalization era, both products with global images and products with local images have chances to flourish as each appeals to its own target market.**

This study has also several shortcomings. First, this research only measures the impact of the effectiveness of self-congruity, which only affects customer loyalty, and only through variables, that is, consumer perceptions on environment, services, products, and prices. Second, this

study does not explain in detail how self-congruity has a direct impact on customer loyalty without explaining the purchasing decision process. Third, all consumer groups in the market cannot be represented by the samples due to the nature of non-probabilistic sampling technique.

This research also offers further researchers to conduct research in other service industries, such as banking, insurance, hotels, and others. For other service industries, the research instruments should be adjusted to the context and nature of services provided by the service organization.

## Abstract

**Manuscript type:** *Research Paper*

**Research Aims:** *This paper seeks to examine the concept of “self-congruity” and its direct and indirect impacts on consumer loyalty of global versus **local** coffee shops.*

**Design/methodology/approach:** *The study is a quantitative study using online survey on 400 respondents, which were distributed evenly to consumers of Starbucks (as a global coffee shop) and Anomali Coffee (as a local coffee shop in Jakarta, Indonesia). This paper employs Structural Equation Modelling (SEM) to study the relationships amongst variables.*

**Research Findings:** *Results of the research show that generally self-congruity has a positive direct and indirect effect on customer loyalty.*

**Theoretical Contribution/Originality:** *The research conveys that self-congruity consistently predicts consumer loyalty in various research settings, while environment perception, service perception, product perception, and price perception can influence consumer loyalty in different manners depending on the research context. The research contexts studied (global versus local coffee shops) also contributes to the discussion of globalization effects.*

**Practitioner/Policy Implications:** *Life style products should develop strategies to match the product’s concepts with those of consumer values, particularly with regards to products with global versus local images. Furthermore, managers should pay attention to their pricing strategies where price perception can influence consumer loyalty.*

**Research limitation/Implications:** *This study overlooks stages in the consumer’s purchase decision process where self-congruity can particularly affect a certain stage to finally result in consumer loyalty.*

**Keywords:** customer loyalty, global versus local coffee shops, self-congruity

---

## INTRODUCTION

The development of the coffee shop business has become phenomenal in urban cities, including in emerging countries. A lot of coffee shops are flooding the market. In Jakarta, as Indonesia's capital city, there are as many as 1,083 brands of coffee shops (Wibisono, 2016). A recent Euromonitor report showed that in Indonesia, the growth of cafés with the coffee shop concept reached 16% every year since 2008 (Sudarsana, 2016). The Advisory Board of the Joint Indonesian Coffee Exporters (GAEKI) said that the growth of coffee consumption has always been more than 8% in Indonesia every year, which is above the growth of global coffee demand (2.5%) in 2016 (Idris, 2017). In 2020, the trade value of business in coffee shops in Indonesia is estimated to reach US\$ 1 billion (Wibisono, 2016).

The high level of competition in the business has caused companies to find it difficult to increase the number of consumers in the existing market. Even though marketers already have a target market segment that is considered loyal, the competitive pressure is intense and deliberately directed at changing consumer loyalty and enabling the transfer of brands. Consumers will develop a positive attitude and loyalty towards these products after consumers receive and feel the benefits or value of a product (Mowen and Minor, 2002: 89). The success of a company is largely determined by customer loyalty.

Several studies conclude that conformity can be a very significant factor in customer loyalty (Jamal and Goode, 2001; Sirgy et al., 1991). Conformity is a suitable match between one's self-image and product image, or self-congruity. Following Shamah (2007), this research was conducted to analyze the direct and indirect impact of self-congruity on customer loyalty. Further, Shamah (2007) states that there are indirect and direct impacts of self-congruity on loyalty. The indirect impact of self-congruity is mediated by consumer perception. Consumer perceptions include perception of environment, services, product, and prices (Hyun, 2010 and Soriano, 2002).

The relationships among those variables can draw more interest when placed in the context of globalization and consumption in cosmopolitan cities, including Jakarta. The rise of globalization and development of transnational consumption practices have resulted in the growing number of global branded coffee shop chains. Grinshpun (2012) argues that the global chains are viewed as material flows of commodities, images, and cultural representations, which forge new connectivities between world locations. The global chains, such as and mainly Starbucks, offer their own consumption experience.

However, at the same time, there was also a rapid growth of local brands of coffee shops which attracts their own target market segments. In Jakarta, there were some famous local brands of coffee shops, with the most famous one called 'Anomali'. Anomali is a local brand with more than 20 branches. It has been a 'hot spot' for coffee shop fans in Jakarta. What is the difference in consumption experience created by these global versus local coffee shops? What kind of subjectivity is created? How do the consumers compare their self-image/self-concept with the product image (i.e., self congruity)? How does self congruity influence their perceptions and in turn their loyalty?

While self-congruity has been previously researched, the present research seeks to provide comparison of self-congruity of emerging country consumers with images constructed by international chain coffee shops versus local chain coffee shops. Self-congruity is the comparison between self-image/self-concept and the product image which consumer has and formed from evaluation between product image and affective response (Sirgy et al., 1991 in Kang et al., 2012). Therefore, such a comparative analysis between international coffee shops versus local coffee shops would provide insights as to whether consumers in developing countries have constructed their self-image congruent with the global image constructed by international coffee chains. Comparing scores of consumers' self-congruity with international coffee chain's image with those with local coffee chain's would contribute to the globalization discourse in which globalization is perceived to generate homogenization of identity of consumers in different parts of the world. Results of this research would also provide insights whether local coffee shops which offer localized experiences would be deemed attractive by local consumers.

There are other factors influencing consumers' behavior, such as consumers' self-esteem and self-actualization (Maslow's hierarchy of needs). However, whether the contestation between global versus local images constructed by global versus local coffee chains in shaping emerging countries' identity is congruent with those images is the main interest of this study.

The objectives of this study are two fold. First, we examine the influence of self-congruity on consumer perception and loyalty. Second, we test the relationships of this variable in the contexts of a global brand coffee shop chain (that is, Starbucks) and a local brand coffee shop chain (that is, Anomali). In doing so, we split the model into three parts, that is, the total

data model, the Starbucks model, and the Anomali model. This would also serve as an initial attempt to explore whether the conceptual model holds in both contexts.

## LITERATURE REVIEW

### 2.1. *Self-congruity*

Self-congruity is the comparison between the self-image/self-concept and the product image which consumer has and formed from evaluation between product image and affective response (Sirgy et al., 1991 in Kang et al., 2012). It means the consumer finds the suitable fit between product-user image and self-concept (Sirgy et al., 1985). Moreover, successful attributes/factors can be seen in a brand that is strongly influenced by self-congruity (Aguirre-Rodriguez, et al., 2012 on Klipfel et al., 2014). Consumers buy products and brands that they trust to process symbolic images that resemble or complement consumers' self-image. This will later achieve conformity (Bierley et al. 1988, in Aghdaie in Khatami (2014).

Sirgy et al. (2006, in Koolivandi and Lotfizadeh, 2015) explains that self-congruity includes cognitive and affective assessments of brand names or services or products whose characteristics match consumers. According to Aaker (1999) consumers develop internal imagery with respect to products, brands, or services. This which is shown in many ways, including through direct contact or through word-of-mouth communication. Consumers find or accept a match between their image (self-image) and the acceptance of a product or brand image (Liu, Lin and Wang, 2012).

One of the categories which will result in customer switching behavior is pricing (Keaveney, 1995). The price factors can include high prices, price increases, unfair pricing, and deceptive pricing. Therefore, perception of services provided by a coffee shop will be formed based on an evaluation of products (the coffee, drink, or food served), the environment of the coffee shop (including the design, ambience, and furniture), and price.

### 2.2. *The Factors That Influence Consumer Perception in Service Industry*

Services which are intangible will be evaluated based on their physical attributes. Therefore, service companies will try to communicate their service quality through physical evidence and presentation (Kotler and Keller, 2012). There are a few marketing tools available to influence consumer's positive evaluation, i.e., place (the exterior and interior of the place), people (employee with good service attitude), equipment (the look of the equipment),

communication materials which suggest efficiency and speed, symbols which suggest fast service, and price of the products and services.

Customer choices for service products also depend on intangible attributes, that is the service itself. Parasuraman, Zeithaml, and Berry (1985) state that service quality is evaluated by five dimensions, that is, **reliability**, assurance, tangibles, empathy, and responsiveness. Their model shows that tangibles relate with the **physical** evidence of the service, as mentioned earlier, while the other dimensions **are concerned with** how the service is delivered to customers.

**Service outcome** and customer loyalty is also influenced by various factors. One of **the** categories which will result in customer switching behavior is pricing (Keaveney, 1995). The price factors can include high prices, price increases, unfair pricing, and deceptive pricing. Therefore, perception on services provided by a coffee shop will be formed based on evaluation of products (the coffee, drink, or food served), **the** environment of the coffee **shop** (including the design, ambience, and furniture), and price.

### **2.3. Loyalty**

Loyalty has received a significant amount **of attention** in consumer research. Oliver defines loyalty as "a deeply held commitment to rebuy or repatronize a preferred product/service" (1997, p. 392.). Meanwhile, Kotler and Keller (2016:27) **state** that customer loyalty is a situation where **the** customer consistently **purchases** a product from the same seller. Prior research has often **defined** loyalty as both an attitudinal or behavioral commitment to a brand (Dick and Basu 1994; Oliver 1999). The attitudinal loyalty states that true loyalty exists when there **exists** favorable beliefs toward the brand. The behavioral approach views loyalty as **an** expressed behavior. **It** defines loyalty as a customer's propensity to buy a brand with reference to the pattern of past purchases (Russell and Kamakura 1994). In this research, referring to Chaudhuri (1999) **we** view loyalty as a combination of attitude and habit. Loyalty is the outcome of **the** experience of consumers after visiting a **coffee shop**. The experience can provide **a** certain satisfaction level and form **an** attitudinal loyalty towards the coffee shop. Visiting a coffee shop can also become a habit, in which a consumer has a tendency to visit the same coffee shop despite the low level of satisfaction, due to perhaps the strategic location of the coffee shop (i.e., near one's office or home). On the other hand, a selection of **a coffee shop** can be **an** attitudinal commitment. Drinking coffee can also be a statement of one's self-concept or lifestyle. The wide **distribution** of coffee shops in a metropolitan city **can** also offer a wide

selection of coffee shops. Having observed the emergence of various coffee shop brands in Jakarta has led us to try to relate loyalty with self-congruity.

#### **2.4. Globalization of Consumption**

There are prior studies of the globalization of consumption, with the research targets of various global brands including Starbucks (Thompson and Arsel, 2004). Starbucks has indeed created the coffee culture around the world and has proven to be the 'standard' coffee shop experience at most cosmopolitan cities in the world, including Jakarta. Globalization of consumption has been studied as a homogenization where transnational corporations colonize local cultures (Falk 1999). However, anthropological research suggests that the seemingly standardized experience of global brand consumption has actually varied and is perceived differently by consumers.

Grinshpun (2012) studied the meanings created and attached to Starbucks by Japanese consumers. He argued that Starbucks offers a "cool and foreign" cultural context which are packaged and reconstructed with visual, spatial, audio, olfactory, and other environmental elements. However, Thompson and Arsel (2004) stated that there were no similar, let alone single, interpretation of Starbucks. The interjection of global brands into local cultures paradoxically produces heterogeneity as global brands take on a variety of localized meanings. It is not just localized meaning towards the global brand. We see the phenomenon that global brands have also created their own local product versions. Starbucks, which has created the coffee culture, has also created local entrepreneurs who open local coffee shops. For example, in Jakarta, the coffee lifestyle created by Starbucks has created a lot of local coffee chains which somehow position themselves as an antithesis to the globalized image offered by Starbucks. They have created a local and independent style image. One of the most successful local brands of coffee shop is called 'Anomali'.

We take the theses of Grinshpun (2012) and Thompson and Arsel (2004) as the basis for our present study that there are subjective interpretations by consumers towards the brand they consume. Even though the global brand carries and tries to impose standard global identity, local consumers will somehow interpret their consumption experience based on their personal subjective consideration. Therefore, in this study we use self-congruity as one of the factors forming consumers' perception and loyalty towards coffee shops.

As an earlier attempt, we merely compared consumer responses in terms of self-congruity, perception on environment, products, services, and price, and loyalty for Starbucks versus Anomali. We also compare the magnitude of influences of variables on the others as theoretically proposed and empirically tested by Shahmah et.al (2007). In these two contexts the model holds for service organization with different characteristics, that is, global chain coffee shops and local chain coffee shops.

## RESEARCH METHOD

### *3.1 Hypotheses Development*

#### *3.1.1 Relationship between Self-Congruity and Loyalty*

The direct relationship between self-congruity and customer loyalty has been confirmed in various studies (Sirgy, 1986; Back, 2005; Kressmann et al., 2006; Sirgy et al., 2008; Liu et al., 2012). Oliver (2010) and Kotler and Keller (2016:27). They said that a loyal customer is a customer who has a long time commitment to be a loyal customer (subscriber). They want to come back and purchase many times in the future. Even the other competitors are trying to steal other brand's customer loyalty.

Since self-congruity refers to the degree of compatibility or discrepancy between individual consumer perceptions of the product or brand and their perception of themselves (Sirgy, 1980). The more similar the two concepts are, the higher the preference for the brand. When self-congruity is perceived by consumers to be higher, the consumer tend to like the brand and will become a regular patron (Liu et al, 2012). Higher self-congruity means more positive attitudes (Graeff, 1997) which will result in higher loyalty (Sirgy et al., 1997; Back, 2005). Therefore, we formulate Hypothesis 1 as follows

**H1.** Self-congruity has a positive effect on customer loyalty.

#### *3.1.2 Self-congruity and Consumer Perception*

Belk (1988) argues that understanding consumer behavior requires understanding on how one constructs meanings to his/her possession or choice of consumption. The congruity between consumption and the sense of self will determine one's perception on the product/service consumed. Graeff (1996) also states that there is a positive relationship between consumer image congruity and perception on products, brands, or services. Self-congruity where the image of a product or service or brand is considered increasingly

approaching the **consumer's self-concept** will determine the perceptions of various stimuli surrounding the coffee shops.

Based on **this reasoning**, we formulate Hypotheses 2a until 2d as follows

**H2a.** Self-congruity has a positive effect on the perception of the environment.

**H2b.** Self-congruity has a positive effect on the perception of services.

**H2c.** Self-congruity has a positive effect on product perception.

**H2d.** Self-congruity has a positive effect on price perception.

### 3.1.3 Consumer Perception and Customer Loyalty

The environmental perception has been proven to be the most relevant factor that most **influences** customer perception and behavior, especially related to the restaurant industry (Han and Ryu, 2009; Liu and Jang, 2009; Ryu et al., 2012). The service perception is an employee. It is believed to be an important factor in customer loyalty to the restaurant industry (Reich et al., 2005). The **product** perception (product quality) **represents** most of the decision process/determinants related to loyal behavior in restaurant settings (Clark and Wood, 1999; Ha and Jang, 2010). Price perception is found as a **significant influence on** the increase in loyalty (Sirohi et al., 1998).

**H3a.** Environmental perception has a positive effect on customer loyalty.

**H3b.** Service perception has a positive effect on customer loyalty.

**H3c.** Product perception has a positive effect on customer loyalty.

**H3d.** Price perception has a positive effect on customer loyalty.

### 3.2 Method

### **3.2.1 Research Design and Data Analysis Technique**

This research employs a quantitative approach which focus on hypothesis testing. Data were collected by distributing questionnaires. The distribution of the questionnaire was conducted online using SurveyMonkey. To test the conceptual model, data were subjected to Structural Equation Modelling (SEM) analysis supported by AMOS 22<sup>nd</sup> version. The total sample consisted of 400 respondents. It was divided equally between Starbucks and Anomali. The sample members were consumers who were at least 18 years old and had visited Starbucks or Anomali Coffee at least three times. We tested the structural model three times, using the Starbucks sample, the Anomali sample, and whole sample. While the total data sample model was analyzed to test the hypotheses, the separate analyses for Starbucks and Anomali served as an initial attempt to examine the comparative results from the Starbucks (global-chain coffee shop brand) sample vis-à-vis Anomali (local-chain coffee shop brand) sample. This would also serve as an attempt to explore whether the conceptual model holds in both contexts.

### **3.2.2 Measurement**

The measurement for the variables was adapted from Shamah et al. (2017). A 7-point Likert scale was used to quantify the responses. Measurements include 12 statements for self-congruity, 15 statements for environmental perception, 11 statements for service perception, 13 statements for product perception, 5 statements for price perception, and 9 statements for customer loyalty. Items used to construct the questionnaire are presented in the APPENDIX.

## **RESULTS AND DISCUSSION**

This research test the measurement model (see Figure 2) and the data to get good and accurate results. The data analyses involve several tests. First, normality test. This test was conducted employing Structural Equation Modeling (SEM) technique. In SEM which uses the Maximum Likelihood technique in estimation, normality assumption of the data was required. The value of the critical ratio (CR) can be determined based on the significance level of 1% which is equal to  $\pm 2.58$  (Hair et al, 2006). The result of the normality test (Table 1, Table 2, and Table 3 respectively) for the three models are 91.83% normally distributed for Starbucks respondents, 81.63% normally distributed for Anomali Coffee respondent, and 79.59% normally distributed for total data. This shows good results for the three models.

The reliability of measurement for each of the variables is assessed by examining the consistency of the respondent's answers to each of the questions that measure the variable. The reliability of a variable can be assessed by the value of the Cronbach Alpha Coefficient. The higher the coefficient, the higher the reliability is (Hilton and Brownlow, 2004). The results of reliability tests (see Table 4) showed good results, in which the coefficients were above 0.9.

The validity tests are used to measure the validity of the measurement for each of the variables. Tests of convergent and discriminant validity were then conducted. The convergent

validity test employed AVE calculations and the discriminant validity test used MSV calculations (Hair et al, 2006). The convergence validity (see Table 5) test was examined based on the value of the loading factor of each indicator. The test results in good values, because all values were above 0.5.

Table 4. The Reliability Test of Total Data

Variable	Value	Criteria
Self-congruity	0.937	According to Hilton and Brownlow (2004), data is reliable if the value of Cronbach Alpha: If $\alpha > 0.90$ then reliability is perfect. If $\alpha$ is between 0.70 - 0.90 then reliability is high.
Price Perception	0.919	
Service Perception	0.940	
Product Perception	0.939	
Environment Perception	0.973	
Customer Loyalty	0.905	

Table 5. The Convergent Validity Test of Total Data

Indicator	Value of AVE	Criteria
Self-congruity	0.681	According to Churchill (1979) and Holmes-Smith (2002), data are convergent if the value of AVE more than 0.5
Price Perception	0.697	
Service Perception	0.690	
Product Perception	0.625	
Environment Perception	0.680	
Customer Loyalty	0.676	

The last test was the Goodness of Fit Index, which were based on seven criteria of the model. These criteria were chi-square, chi-square/df, probability, GFI, AGFI, CFI, and RMSEA. The results on Starbucks, Anomali, and the combined model (see Table 6 to Table 8) showed that not all criteria were met. However, the values were still acceptable because the average value of each criteria for each model fall in the range of zero to one (Santoso, 2012). Although it did not fulfill the criteria but overall the value of each measurement was still acceptable of a fit level of 70% and with the value of RMSEA  $< 0,08$ . These results were still considered acceptable. Therefore, the structural model was supported by the results of this research.

Table 6. Goodness of Fit Index Respondents of Starbucks

Goodness of Fit Index	Criteria	Result	Conclusion
Chi-square	As low as possible	2228.407	Acceptable
Chi-square/df	≤ 2.00 or 3.00	2.065	Acceptable
Probabilitas	≥ 0.05	0.000	Acceptable
GFI	≥ 0.90	0.721	Acceptable
AGFI	≥ 0.90	0.670	Acceptable
CFI	≥ 0.90	0.901	Acceptable
RMSEA	≤ 0.08	0.073	Acceptable

Table 7. Goodness of Fit Index Respondents of Anomali Coffee

Goodness of Fit Index	Criteria	Result	Conclusion
Chi-square	As low as possible	2611.866	Acceptable
Chi-square/df	≤ 2.00 or 3.00	2.370	Acceptable
Probabilitas	≥ 0.05	0.000	Acceptable
GFI	≥ 0.90	0.795	Acceptable
AGFI	≥ 0.90	0.763	Acceptable
CFI	≥ 0.95	0.928	Acceptable
RMSEA	≤ 0.08	0.059	Acceptable

Table 8. Goodness of Fit Index (Total Data)

Goodness of Fit Index	Criteria	Result	Conclusion
Chi-square	As low as possible	2424.827	Acceptable
Chi-square/df	≤ 2.00 or 3.00	2.401	Acceptable
Probabilitas	≥ 0.05	0.000	Acceptable
GFI	≥ 0.90	0.800	Acceptable
AGFI	≥ 0.90	0.767	Acceptable
CFI	≥ 0.95	0.929	Acceptable
RMSEA	≤ 0.08	0.059	Acceptable

In terms of respondents' profile (see Table 9), the respondents of Starbucks showed similar characteristics with those of Anomali. The majority of respondents were between 26-35 years old, had an undergraduate educational background, an average monthly expense that was more than Rp 5,000,000.- and most of them was coffee enthusiasts. Respondents of both groups were regular customers who have subscribed for more than three years and visited the café at least once a month. These characteristics of the respondents can serve as an overview of consumer profile of coffee shops in Jakarta.

In the hypotheses testing, results on Starbucks sample group (see Table 10) showed that only 2 out of the 9 hypotheses were not supported (p value greater than 0.05). The hypotheses were the positive influence of environment perception on customer loyalty (H3a) and the positive influence of product perception on customer loyalty (H3c). Therefore, only environment perception and product perception failed to mediate the influence of self-congruity on customer loyalty.

Table 10. The Coefficient and Significance of Influence (in three models tested, i.e, for Starbucks, Anomali, and Total Data)

Relationship between Variables	Coefficient and Significance of Influence		
	Starbucks	Anomali	All Data
Self-congruity → Customer Loyalty	0.334***	0.257***	0.246***
Self-congruity → Environment Perception	0.300***	0.276***	0.282***
Self-congruity → Service Perception	0.350***	0.262***	0.268***
Self-congruity → Product Perception	0.408***	0.337***	0.358***
Self-congruity → Price Perception	0.404***	0.312***	0.336***
Environment Perception → Customer Loyalty	-0.051	-0.158	-0.171
Service Perception → Customer Loyalty	0.227***	0.047	-0.024
Product Perception → Customer Loyalty	0.303	0.550***	0.685***
Price Perception → Customer Loyalty	0.653***	0.536***	0.476***

Note:

\*\*\* : significant at p values  $\leq 0.001$

The results on the Anomali sample group (see Table 10) showed that only 2 out of the 9 hypotheses were not supported. The unsupported hypotheses were the positive influence of environment perceptions on customer loyalty (H3a) and the positive influence of service perception on customer loyalty (H3b). Therefore, environment perception and service perception failed to mediate the effect of self-congruity on customer loyalty.

Analyses were also conducted on the total data model (see Table 10 and Figure 2). Results showed that only 2 out of 9 hypotheses were not supported ( $p > 0.05$ ). The unsupported hypotheses were the positive influence of environment perception on customer loyalty (H3a) and the positive influence of service perception on customer loyalty (H3b). It therefore implied that environment perception and service perception did not mediate the influence of self-congruity on customer loyalty.

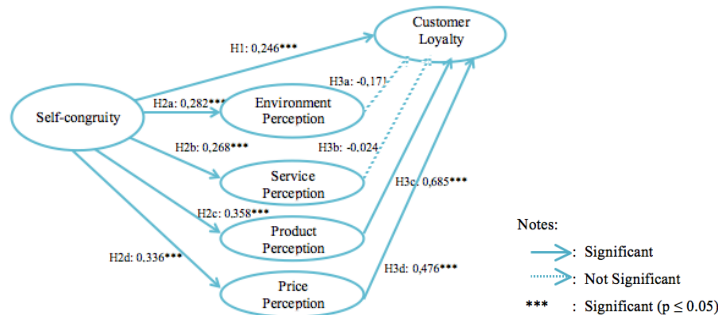

Figure 2. The Structural Model of Total Data

The value of R-square showed the ability of independent variables (X) to explain the dependent variable (Y). According to the Guilford Theory (1956), the results showed that self-congruity, perceptions of the environment, product, service, and price can explain customer loyalty for 75.2% of the Starbucks sample. Meanwhile, the Anomali sample showed the R-

square value of 59% in which self-congruity, perceptions of the environment, product, services, and price can explain customer loyalty by 59%.

If we compare results between Starbucks and Anomali, main argumentations about the importance of self-congruity in shaping consumers' perception in the service industry is clear. Self-congruity is also an antecedent of loyalty.

Results in both contexts also show that environment perception does not influence loyalty. This might indicate that consumers' perception in terms of environment of both coffee shops are already formed and therefore do not influence customer loyalty. There are also conflicting evidence. In the context of Starbucks, service perception positively influences customer loyalty, while product perception does not influence customer loyalty. In the context of Anomali, product perception influences customer loyalty positively while service perception does not. This findings might indicate that service matters in the context of Starbucks. For Anomali, consumers are concerned about its products.

Besides hypotheses testing, we compare the average scores of each of the variables for Starbucks and Anomali (see Table 11). Interestingly, average scores for Anomali were all higher than those of Starbucks. Statistically, however, only the mean difference in terms of self-congruity and price perception were significant. Respondents of the Anomali experience were more self-congruited compared to those of Starbucks respondents. The difference of price perception was confirmed by the more expensive prices of Starbucks products compared to Anomali.

Table 11. The Result of Independent t-test (Starbucks versus Anomali)

Variables	Average Scores for Starbucks	Average Scores for Anomali	Mean Difference
Self-congruity	4.0544	4.2661	-0.22167***)
Environment Perception	6.0207	6.0839	-0.06321
Service Perception	5.9558	5.9725	-0.01667
Product Perception	5.9150	6.0043	-0.08929
Price Perception	5.2988	5.5525	-0.25375***)
Customer Loyalty	5.1521	5.3336	-0.18143

Note: \*\*\*: Significant at  $p \leq 0.05$

## CONCLUSION

The present research shows the importance of self-congruity in forming consumers' perception on environment, service, product, and price. As Belk (1988) pointed out our possessions (and consumption) are reflection of our identity. One's belonging and choice of consumption are the extension of the self. The way one perceives a product/service is indeed a result on the way one perceives compatibility (or congruity) between him/herself with the product/service. The importance of self-congruity in influencing customer loyalty is perhaps

underlined by the findings that perception on environment, product, and service did not mediate the affect of self-congruity on customer loyalty.

The present research contributes to the understanding of phenomena of symbolic consumption of the society residing in metropolitans. Contextually, this research provides data from Jakarta, the capital city of Indonesia. Indonesia is a fast growing emerging country and is in the Big 20 countries in term of GDP. With the penetration of global brands such as Starbucks, this research provides insights on the development of local brands. While research on the globalization of Starbucks (Grinshpun, 2012; Thompson and Arsel, 2004) has offered useful insights on the adoption of global brands, this present research intentionally compared the perception on global chain versus local chain. The results are intriguing for self-congruity scores for local chain was in fact higher compared to that of global chain. This implies that the society has somehow been more interested in local brands rather than consuming brand with global identity. Also, this may lead to further investigation on the role of global brand in stimulating the growth of local brands or the interrelationships between the global and local brands. In this case, Starbucks has perhaps stimulated the local demand for coffee shops and thus induced the emergence of local brands. Both Starbucks and Anomali have contributed to the market size and growth of coffee shops in Indonesia.

This research offers several managerial implications in developing customer loyalty in the service industry, especially coffee shops in Jakarta. **Due to the importance of self-congruity in forming customer loyalty, companies have to attempt to build congruity between consumers' self image (or how consumers perceive themselves) and the image of the company. In doing so, companies have to target specific market segment(s) whose images are congruent with company's images. Alternatively, companies have to formulate market branding and communication strategy in such a way to build congruency between company's image with customer's self-image. For example, international-chain coffee shops can portray its global image via its global branded product, service, outlet, and advertising strategies to appeal to customers with global aspiration. Meanwhile, local coffee shops can communicate its locality (local products, local designs, and local service culture) to appeal to customers who favor locality. The findings of this study also provide insights that in the globalization era, both products with global images and products with local images have chances to flourish as each appeals to its own target market.**

This study has also several shortcomings. First, this research only measures the impact of the effectiveness of self-congruity, which only affects customer loyalty, and only through **four** variables, that is, consumer perceptions on environment, services, products, and prices. Second, this study does not explain in detail how self-congruity has a direct impact on customer loyalty without explaining the purchasing decision process. Third, all consumer groups in the market cannot be represented **in** the samples due to the nature of non-probabilistic sampling technique.

This research also **encourages** further researchers to conduct research in other service industries, such as banking, insurance, hotels, and others. For other service industries, the research instruments should be adjusted to the context and nature of services provided by the service organization.
