Hypertension is a prevalent disease all over the world. The prevalence of hypertension increases year by year. Therapy of hypertension is more complex when it is co morbid with vertigo. The complexity of therapy of hypertension patients with vertigo could potentially lead to Drug Related Problems (DRPs). Therefore, this study aimed to evaluate the use of diuretic drugs in the therapy of geriatrics patients with vertigo at Panti Rini Hospital Yogyakarta who were hospitalized during January 2012 to June 2013.

This is a non experimental study applying a descriptive study design using retrospective dat. Data were collected through medical records. Inclusion criteria of the subjects were those who were over 60 years old and were diagnosed hypertension accompanied by vertigo, those who were treated using diuretic medicines and have the relevant laboratory test results recorded in their medical records. The data were analyzed using evaluative approach by comparing to the therapy standard.

There are 20 subjects who met the inclusion criteria and were included in this analysis. The most diuretics commonly prescribed is furosemide (90,5%). There are 31 cases of DRPs related to the use of diuretics. The DRPs include dosage too high (1 case), dosage too low (3 cases), drug interactions and side effects (13 cases), and 14 cases of wrong drug selection.
