This paper investigates an innovative intersection between Indonesian literature and artificial intelligence (AI), tracing a nascent pathway of narrative development. Through a comparative approach, we discuss how AI-generated stories mimic, but also build upon, the traditional Indonesian narrative discourse. We are rely to machine learning algorithm and curated data set of Indonesia literary works to generator the narrative that will help you write a ton story with 100% local flavour Again, you have to get the difference when you let an AI code. Moreover, this fusion highlights AI's importance to the preservation and revitalization of intangible cultural heritage. So our study restructures literary generation but we trust its implications extend beyond the literary novel to actually suggest possible strategies for culture preservation, applications in education, and AI in the creational landscape. Significantly, it becomes a modern lens that further enhances the evolution of traditional narratives, wherever they are rooted, through the prism of highlight and digital storytelling, presenting this new model that stimulates the imagination beyond the limits of the isolated discovery, using storytelling and highlights as a way of inspiring a new relationship and guide a model for the symbiotic relationship between technology and traditional narratives.
